Profile

Marketing manager at an HR agency, using LLMs at work since ChatGPT came out. I built **my own AI office** on Claude Code: agents write code, run social accounts and maintain my Avito hiring product. My second skill is **checking model output**: one task on four models, then an acceptance checklist.

Experience

Marketing manager, hiring automation

Citystaff · HR agency, rotational shift staffing · Saint Petersburg

- **Run candidate acquisition** on hh.ru, Avito and social media. Wrote Vahta-Suite for Avito: 6 client accounts, 5,319 ads in one database.
- **Follow up with quiet candidates** by script: it walks the applications day by day, writes to those who never replied, a send log prevents duplicates. 30 messages a day.
- **Automated ad uploads** into three Avito accounts: descriptions from the client's DOCX, a script fills all 22 columns, 90 checks before the API call.
- **Built funnels and chatbots in n8n** for Telegram and Instagram: the bot keeps context, matches the tone and answers with a pause, like a person.
- **Cut reporting time by 90%** with Google Apps Script. Run **Yandex.Direct full cycle** with lower cost per lead; voice robot, speech analytics.

Multi-agent AI office, personal project

237 commits in 5 months · 4 systems in daily use · design, code, acceptance

- **Built a multi-agent system** on Claude Code and the Agent SDK: 5 roles, 15 skills, memory and an acceptance guideline: 8 criteria for text, 6 for visuals.
- **Rebuild the office rules weekly**: the rulebook cut from 166 lines to 60, a linter now checks it. Tried Gemini CLI and Codex, stayed on Claude Code.
- **Social media runs as a pipeline**: two Telegram channels (43 posts), YouTube, Dzen, videos with my cloned voice; an AI replies in Telegram as me via Telethon.
- **Job and order scanner** covers hh.ru, Kwork, Telegram, Remote OK and Hacker News: 35 relevant out of 213 a day.

Projects

Avito Vahta-Suite · production product for an HR agency

Python · FastAPI · pywebview · SQLite · Playwright · aiogram · Google Sheets

A desktop app and two Telegram bots for shift hiring on Avito: 6 accounts and 5,319 ads import in 100 seconds. 657 automated tests, 24/7 on a Windows Server 2022 VDS, moved between countries without stopping the bots.

657

automated tests,
24/7 on a VDS

Jarvis · voice assistant for a PC

Python · Electron · WebGL2 · Vosk · Claude Agent SDK

Runs a PC and the office by voice: commands are parsed by templates, Gemini Flash-Lite and Claude. A sphere on WebGL2 at 60 FPS, dictation never leaves the machine.

60 FPS

sphere on WebGL2

VPN Split Tunnel

PowerShell · FastAPI · pywebview

Selected sites bypass the tunnel through /32 routes. After a leak and a three-minute startup I made seven fixes: it now starts in seconds.

219

tests

ai-forge · content pipeline

LangGraph · Pydantic v2 · OpenTelemetry · OpenRouter · MiniMax TTS

An agent graph "research → script → voice-over → video": five scripts in 44 seconds for 3 cents. Cheap models via OpenRouter, strong ones via the Anthropic SDK.

44 sec

five scripts for 3
cents

RescueKit · data rescue

Python · SHA-256 · Windows

Disk analysis at 2,500 files a second, backup by priority, hash checks, quarantine for executables and disguised files. A test with 36 traps: 35 saved, 1 miss in the report.

35 / 36

traps in the test

Ilm-price-monitor · open source

Python · OpenRouter

Calculates the cost of a task across 100+ models via OpenRouter and shows where you overpay. Code is open on GitHub.

Mar 2022 – 2023
Audience parsing in social
networks, cold outreach,
leads through to payment.

Call centre operator

T-Bank
2023
Consulting customers on
financial products.

What I bring to an AI development & testing team

- **Evaluating model output.** One task goes to Claude, Gemini, DeepSeek and YandexGPT; I write the expected answer first and check the output against a checklist.
- **Fact-checking as a rule.** A number goes into a report only from a command that was run, "it works" only after I saw the output. A machine-text detector before every publication.
- **I look for criticism myself.** Non-trivial results go to a second agent for adversarial review, failures go into a decision log with a rule. The RescueKit miss above came from that.
